Discharge Characteristics

Discharge Time vs. Discharge Current

Life Characteristics in Stand-By Use

Charging

Cycle Applications: Limit initial current to less than 33.75A. Charge until battery voltage (under charge) reaches 14.40 to 15.00 volts at 77 °F (25 °C).

“Float” or “Stand-By” Service: Hold battery across constant voltage source of 13.50 to 13.80 volts continuously. When held at this voltage, the battery will seek its own current level and maintain itself in a fully charged condition.

Note: Due to the self-discharge characteristics, it is imperative that they be charged within 6 months of storage, otherwise permanent loss of capacity might occur as a result of sulfation.
